

Event Monitoring System Using Mobile Communication For INTI-UC

Prepared by: Abdulhamid Faisal Alsaqqaf

PROJECT OVERVIEW

Usually we see it easy to fire an event, to make a function, or to book a venue and we really don't know all the procedures beyond this. The author would like to identify what events means, scheduling and why event monitoring is necessary in general without specifying any target users.

An event is a function or a gathering for students to perform certain activities. A schedule by this definition is sometimes referred to as workflow. In some cases scheduling software is used to allow organizations to better manage of the venues. An event monitoring is necessary for keep tracking on day-to-day functions either for the students or even for the staff themselves.

That how an event is defined in our points of view, other than that we would like to know where to accommodate this event, there where the stuff most often creates a booking forms. In larger operations, the person in charge or scheduling specialist may be solely dedicated to writing the schedule. And after planning for that specific event and find the venue, a simple question should come to our minds how to get as much as we can visitors to this event. In other words how advertise for our event.

All this complicated operations came into the author's mind, therefore the author had to find the target user who the system will be useful for and then the idea started to expand by the time to get the maximum success in the user point of view.

INTI-UC is a university in Malaysia with multiracial students from every part of the world. It was founded in 1986 which has a strong emphasis on teaching and lecturer standards. With providing all the student's needs, the author decided to choose INTI-UC to study and implement his project since he has the needed information and has experienced the problems before.
