Wireless Private Network Communication within an Organization – Memo Circulation Management System

Prepared by: Yogeswary Balakrishnan

ABSTRACT

This project mainly focuses on the sending and receiving of memos in an organisation. Especially as the project title mentions, when a server and clients are connected in a wireless environment, it would successfully perform the sending and receiving reliably and on time. By just making a few clicks of setting to the client, it will be successfully connected to the server via a wireless router.

Wireless Private Network Communication within an Organization – Memo Circulation Management System will allow the authorised staff to log into the system. It also acts as a reminder for the user as the system is able to prompt reminders according to the date and time set by the user. This is one of the advantages of this system where reminders are generated for the users. Apart from that, the system can perform the sending and receiving of memos, which are the very basic features and other extra elements which makes it to be flexible to be utilized in any organisation.
