Enhanced Method of Steganography Technique in File Security System

Prepared by: Tri Agif Irawan

ABSTRACT

The project addressed enhanced method of Steganography technique in file security system.

A method of hides and protects the file into another file. Every application provides the output file which record and store the information about the task have been done with that application. This file should be confidential due to few numbers of eavesdroppers who taking advantage on revealing the confidential data file. In order to protect these data files, the technique to produce a good tool for protecting the file should now have been produced.

The technique of Steganography algorithm has been researched long time ago, but the advance of computer science and technology makes the algorithm keep to be researched again in order to find better and efficient algorithms.

In this project, the author studies on the technique available identify the problem and issue, investigating the existing Steganography tools and design and implementation of the proposed algorithm in order to produce better Steganography tool.
