A STUDY AND IMPLEMENTATION OF SERVLET GATEWAY SERVER AND J2ME CLIENT SYSTEM FOR MOBILE STOCK EXCHANGES

Prepared by: Dany Heng

ABSTRACT

This project aims to develop a servlet gateway server that informs the real time status of market stock exchange ad quotes of certain company or organization. First, the client needs to download the J2ME application into the phone and install it. Once installed, using the application they can add stock into the database, and then view the stock information either in live form or even in historical chart form. And at last they can manage their stock symbol database on their phone. By using this system, it will be easier for the users to obtain the status of the stock exchange in the market especially for business people who are mostly interested in buying shares.
