

# **E-MONITOR – AN IMPLEMENTATION OF A REMOTE SERVER ADMINISTRATION SYSTEM**

Prepared by: Georgina Miriam Fernandez

## **ABSTRACT**

---

Although performance monitor (Perfmon.exe) has found its place in the areas of base lining and performance evaluation, its limitations resolve on the inability to be utilized by a user from a remote workstation outside the local area network. The rationale for the proposed project would be to assist server administrators during absence from the console of a server. Systems downtime is often longer than necessary due to administrators not being at the controls of their servers outside the LAN. Downtime therefore, becomes an affair to be avoided at all cost.
