

WIFI BASED FILE TRANSFERRING AND WIRELESS PRINTING

Prepared by: Cheng Yi Xing

ABSTRACT

The growth of the WiFi technology affects the demand on WiFi applications. The demand for WiFi seems to be higher than the Bluetooth and infrared. The author would like to contribute to the market by proposing a system that is using WIFI technology. This project is mainly about creating the client/server based files transferring and wireless printing system using the WIFI technology.

In this project, the author would give the brief information about the WiFi technology so could understand how the technology works. Besides that, in this project, the author also had explained the progress of developing the proposed system. Entire process for development of the proposed system had been explained well in this project.
