

DEVELOPING SECURED FILE TRANSFER PROGRAM BY USING ENCRYPTION TECHNIQUES

Prepared by: Tai Foo Chai

ABSTRACT

This project mainly focused on various encryption techniques used. The research will be done in the various techniques of the encryption use in the today's world. The different encryption algorithms are identified and investigation of their problems is carried out. The research also identifies the potential use of these technologies in the future. In this project, a program is developed that allows user to make a secured transmission of files between computers in remote environment. The file is encrypted during the transmission process. The combination of two types of encryption techniques will be applied to this system.
