

COMPUTER-BASED NETBOARD ADVERTISING SYSTEM

Prepared by: Liao Yee Tsze

ABSTRACT

This project develops a system that provides a net board that allows user to advertise their items (textbook, reference, computer equipment, house, room, vehicle, etc) for sales or to rent. This system will also allow user to publish the items they want to buy or rent. Many of such advertising board systems are now completed manually, but they are always lack of update feature, and hard to identify items that are not available for erase. The lost and missing notice or being torn off is another problem in the manual system. Compare to the manual system, the NetBoard Advertising System can automatically or manually (by owner) update the information on board. Furthermore it could avoid missing or losses if any advertising notices. Besides, the new system will greatly reduce the manpower used to fill the advertising form and to paste the notice on the board. Finally the NetBoard Advertising System will also reduce the paper used to save cost and saves the environment.
