

STUDY AND IMPLEMENTATION OF A TOP ARTISTS AND FILMS ENTERTAINMENT SEARCH ENGINE

Prepared by: Tsen Chyong Huey

ABSTRACT

This search engine is based on indexing scheme technology. It organizes the information about the top artists and top films into indexes to facilitate the searching process. It is developed using Java or JavaScript. When users click on the link, the search engine would link to more detailed list and display the information needed right away. Thus, users can obtain their query results without jump to other site. In addition, this search engine also provides keyword search scripts that can be created in such a way that when the user clicks on a keyword, the URLs for relevant web pages are displayed. Besides, users may enter their search criteria or queries in the search entry box, and the search engine will perform the search. Another feature of this search engine is that it will connect users to other major engines as well.
