

# **AN IMPLEMENTATION OF A TRAVELLING SYSTEM FOR TRAVELLING AGENCY WITH MANAGEMENT INFORMATION SYSTEM**

Prepared by: Cheah Ching Yee

## **ABSTRACT**

---

The traveling system is to investigate the current traveling system's strengths, weaknesses and develop a new system that is more effective and powerful than the current system. This system is basically to help users make registration, cancellation, hotel booking, providing traveling package, buy bus ticket and so on. The customer can make reservations directly through the Internet or go to the traveling company and make reservations there. Therefore, customers who are from other countries can also make reservations. After the customer decides which traveling package to choose, this system will recommend some hotels for them and help them to book a hotel. After the customers have decided on the package they want, they can make their payment through Internet. It also provides an easy and better way for travel enthusiasts to check for the traveling information. This system will include all management information system which will help to manage, organize and control all the information involved in the transactions. So, it will make the registration or daily transactions more convenient and effective. By using this system, it can reduce the paperwork.
