

A STUDY AND IMPLEMENTATION OF E-COMMERCE BASED ONLINE PURCHASING SYSTEM FOR ELECTRONIC DICTIONARY WITH ENHANCED SERVICES

Prepared by: Zhou Chen Da

ABSTRACT

This project studies definition and identification of E-commerce and its purchasing process as well as the concept and features of online purchasing system and its interface and background information management. The project mainly investigates online purchasing system with webpage design for business. The project designed concentrated on customers' views, which includes search, security, accounting and information management functions. Customers can purchase goods and services on the internet at home at any time. With the graphic interface webpage designed with ASP platform in the system, users will communicate with the system easily. The most advantage of the system is customers' concentrated services like users account management, store management, new production introduction, reminder and forum and follow-up services like delivery after ordering
