Alarm Notifier

Prepared by: Wong Weng Seong

ABSTRACT

Every final semester student are required to designed their circuit and product to fulfill the requirement of one of the subject in the final semester. By taking this opportunity, I had designed a project which title is "Alarm Notifier". Alarm notifier is applying to a car to enhance the security system.

Nowadays the cases about car stolen or car robbed are increase rapidly. Unfortunately, my father was one of the victims in these cases. So it's elicitation me an idea to design this project. According to the car stolen case of my father, we believed that the car alarm was alerted when the stealer take action to my father's car. However the distance between the car and us are too far and caused that we totally didn't know what happening to the car. Till we back to take the car then just noticed that the car was stolen.

As a result, a device that can inform the car owner when the car alarm was alerted is needed to face this kind of car stolen problems. In addition of the uses of SMS (Short Message Servicing) is rife ness, so it's possible to use SMS to inform the car owner by the description of text.
