

Main Remote – Alert

Prepared by: Lee Yuh Fenn

ABSTRACT

This device is used to transmit signal to receiver to activate a sound, light alert. When pressing the push button of the transmitter a sound and / or light alert is activated in the receiver. This system is uses no wiring or radio frequency. The transmitter signal is conveyed into the main supply line. It can be used at home from attic to cellar, simply plugging transmitter and receiver in the wall sockets. As we know that AC mains are connected all through the house. So the transmission range can be very good, provided both units are connected to the main supply within the control of the same light-meter.
