Design of Automatic Traffic Indicator

Prepared by: Lee Chee Khai

ABSTRACT

Have you come screaming over the creeping traffic in the highway? You have no choice but to lock them up, join the creeping pack of cars and crane your neck, wondering why you don't choose another road few minutes ago before you come to the jamming area.

Now with the Design of Automatic Traffic Indicator, traffic condition will be shown on a signboard a few kilometers away from the jamming spot where you are not too late to skip the traffic jam by choose an alternative route to reach your destination without delaying your precious time.

The Design of Automatic Traffic Indicator also holds an important role in controlling the traffic and helps to minimize the traffic congestion by showing the drives the conditions of the traffic in front of the road which they are heading. When the traffic condition is being shown to the drivers, traffic jam will reduce because drivers can make a decision of choosing alternative route so it will directly reduce the jamming traffic.
