

BLENDING MACHINE

Prepared by: Cheah Wei Chen

ABSTRACT

Production of automated machines used in processing and preparation of food and drinks is occurring at a large scale as the demand of it is high due to it being able to save time and even to the extent of cost. However, little has been done in the advancement of machines that is able to prepare any kind of powdered drinks. There are of course some out there in the market but they are mostly large and bulky. Powder blending machines that are sleek and smaller in size is still an idea that has not come into past. The immediate objective would be developing a powder blending machine that allows a variety of functions to be added into it. Different functions will be considered and added in producing a blending machine that is able to prepare drinks of any kind from varying the strength of the drink to the blending time. This would be the first of its kind in preparing drinks fully automatically based on the user's selection. Through this, the development of machines of this very kind will receive more attention in the near future from developers as well as consumers.
