

TOOL FOR CARVING A SINGLE LARGE CHUNK OF PINEAPPLE FLESH

Prepared by: Lau Chun Kit

ABSTRACT

This project is mainly about design and fabricates a manually operated mechanical tool that will carve chunk of pineapple flesh from a pre-prepared pineapple which means by the top and bottom parts of the pineapple has been removed. This project is so called a small type of pineapple cutter or peeler, which is portable and easy to operate by everyone.

The main outcome of this project is to present a workable machine that can deliver its intended objectives of producing chunks of pineapple flesh by single downward stroke of its circular blade on the pre-prepared pineapple. This tool will facilitate and hasten the process of canning of pineapple flesh. Besides that, skin and core of pineapple will be removed at the same time. Since this tool is dealing with fruits, the tool is made of stainless steel, which is rust resisting.
