

AN AUTOMATIC ANIMAL FEEDER ENHANCED WITH WASTE DISPOSAL MECHANISM

Prepared by: Mohd Fariz B. Mohd Amin

ABSTRACT

This project on the whole aims to create a system that will provide enough food and water for the pet daily consumption and needs automatically. The proposed project includes a built in mechanism for feeding and disposal. It would cover areas such as how the entire system works, the design, and the program used in order to make this project a success. In completion of the project, I have used software such as AutoCAD for designing the project and MPLab for the program. The usage of these two important software leads to the workability of the system. The area of research will be on the various tools, techniques to be used, appropriate design along the completion of the project. In short, I developed the project with the intention that it could make someone's life easier and to propose this idea to the market.
