

THE INFLUENCE OF CURING ON THE COMPRESSIVE STRENGTH OF CONCRETE

Prepared by: Cheong Boon Wai

ABSTRACT

In this propose as the title suggest, I will be performing the act of concrete cubes making. In this experiment, I will be preparing concrete cubes with a constant ratio for all the materials. Then, I will leave the cubes in different conditions. The conditions are in the room, verandah, roof and water.

From the results obtained, it can be tabulated and represented by graph. A conclusion can be made to show the relationship between compressive strength of concrete and time different conditions
