

# THE DESIGN OF A 'T-SHAPE' FLY OVER BRIDGE BETWEEN BUILDINGS

Prepared by: Chow Kim San

## ABSTRACT

---

On behalf of the project title “The Design of A ‘T-Shape’ Fly over Bridge between Buildings”, the objective of the project is to design a design a bridge to let people cross-over the road from one side to other. And my project is little bit different with other pedestrian bridge. Let’s say if the normal bridge, pedestrian only can choose either go left or right when they cross the bridge. And the title of the bridge that I design is can let pedestrian choose go left, go right or go to the third direction. Normally this kind of ‘T-Shape’ bridge is built on the ‘T-Junction. The other special point of this bridge is it is connected three buildings, people can in the building can direct across the road by using this bridge and no need to walk outside the building and use the bridge to cross the road.

This report also can be used as references and guideline to those who prefer to design the similar types of the fly-over pedestrian bridges.
