

# WIRELESS COMMUNICATION BETWEEN 2 COMPUTERS

Prepared by: Lum Tjer-Harn

## ABSTRACT

---

This report is a summation of my entire work in attempting to design and build a working model of wireless communication between 2 computers. In it you will find my observation, testing and conclusion of the whole project. The challenge of actually having a wireless communication lies not in its hardware and software but in the perseverance of man in making it work. The possibility of having a wireless internet world propel me to test it's authenticity ad that was why this project was chosen. Through it only demonstrates a very basic infrared diode transmitter and receiver at work, but it is the foundation of which wireless communication is based on. In it you will find the components, schematics and other refernces used which justifies each part assemble.
