

FM RADIO RECEIVER

Prepared by: Xi Quan

ABSTRACT

My project title is FM Radio Receiver. This project is a communication tool about FM. My radio receiver is mono radio receiver. It is a very simple VHF FM receiver which is little more than a single IC and a 'slack handful' of capacitors. The FM receiver is device receives the frequency modulation signal then demodulation the signal, and amplifier the audio signal uses the pre-amplifier and the amplifier. The FM receiver is can receive the frequency 88-108 mhz. after the signal is amplified; we can get the source signal like broadcast. The general scope of my project is to just do that.
