

DOORBELL MESSENGER

Prepared by: Loi Jiabin Kelvin

ABSTRACT

This report is all about a device that is used to transmit the ring of the doorbell to the place wherever you want. This device will not only provide ease to the household usage, but will omit the old times overhead cables, which are used as the transmission medium between the transmitter and receiver. As we know that AC mains are connected all through the house. By using this existing feature, this idea can be done easily. The only way to do this is transmitting the signal through the neutral line.
