

INTELLIGENT DOOR LOCK

Prepared by: Ang Wee Wen

ABSTRACT

Now this is a project where you can make a coded door lock with a cheaper price compared to the market price. This door lock, as mentioned, is able to record a password code. Of the user enters the code wrongly, the alarm will sound when he try to enter to the building. There are some other cases where the alarm will sound which will discuss later.

The main objective of this project is to provide a cheaper door lock that is used to prevent further more theft cases. On the other hand, this is also quite an advance technology used for normal cases, unless it is for high security purposes, I would recommend the voice recognize door lock or thumbprint recognize system.
