

LIGHTS ON REMAINDER

Prepared by: Goh Teck Chiang

ABSTRACT

My final year project title is Lights on Remainder. It basically is an intelligence circuit uses to switch on or off the light automatically in a room. This circuit is mains to convenience people. In modern world, people more like things to be simple and convenience. This circuit not just provided an auto light switch on or off. It also provides LED indication to show the room is occupied or empty. Furthermore, there is a melody tune to remind the user to close back the door after used. Thus, a timer is attached to the circuit for the purpose to switch off the light in case user forgets to close the door. Lastly, there is a backup battery facility as well.
