

WIRELESS FM MICROPHONE

Prepared by: Lim Yew Kim

ABSTRACT

What do you understand about wireless FM microphone?? The wireless microphone is almost similar to the other ordinary microphones that are in the current market. However, the microphone that I am working on will have a slightly different feature. This microphone does not have any wires between the transmitter and the receiver as ordinary one. Besides that, frequency modulation (FM) will be generated and transmitted, this frequency will be received by radio using FM band.

This microphone is extremely small, easy to build and convenient to use. Since it is small, it can be used in any occasion be it party, live concert, lectures, or recording purposes. Besides, it can also be used for spies in order to obtain evidence.
