

ENVIRONMENT SAFETY DETECTOR

Prepared by: Chia Boon Chien

ABSTRACT

The title of my final semester project is 'Environment Safety Detector'. For this project mainly is a combination of a dangerous gas detector and a heat detector.

The purpose of this project is to build up a device that can detect dangerous gas and high temperature. While looking for project title I have found out that the detector in the market only have either one function, so I decided to combine it and it can be very cheap while having two types of detector but with only paying for one. I will have a description of the working of my project in the body.

The conclusion of this report would summarize this report and include the major outcomes of my project and recommendations for further work to be carried out. Next a list of reference will show all the relevant resources of my information and research of my project and follows by the appendix section.
