

DESIGN A LESS POWER CONSUMPTION FAN

Prepared by: Hiew San Loong

ABSTRACT

The title of my report is a Less Power Consumption Fan. The main objective is to construct a fan that is less power consumption compared to the existing fan.

I had used the theory of car recharging system to design the fan. This is because I found out that this is the easiest way for me to construct the prototype. Somehow, there are still some problems occurred during I tried to construct my prototype. Research had been done in this case in order to collect more information. On top of that, existing fan and car engine had been studied too.
