

PROCESS ANALYSIS FOR CIRCUIT BREAKER MANUFACTURE

Prepared by: Ng Tzuu Bin

ABSTRACT

This report deals with the design of the circuit breaker assembly for improving human welfare as well as enhancing the operator performance. It tends to provide the audience a base of understanding how the process analysis can act on designing an effective assembly line.

In the old method, the left hand holds the base during most of the time while the right hand works productively. The motions of the two hands are neither simultaneously not symmetrical.
