

# IMPROVING ON THE CONVENTIONAL TYPE OF BABY WALKER

Prepared by: Ann Pei Sze

## ABSTRACT

---

Baby walker is widely used among the 80-90% of households and that 30-40% of children in walkers is involved in some type of mishap ranging from finger entrapment to tipovers, to falls downstairs, producing head injury. Most of the time, when the baby inside the walker runs very fast and kicks something fixed on the floor; it will easily cause the whole baby walker to overturn. Moreover, the conventional types of baby walkers do not give a proper back support for baby since the seat is not really being seated.

It is hoped after passing through some implemented testing, the new improved baby walker will provide safer, more convenient and more comfortable features for the user of baby walker.
