

DRYING COCOA BEAN BY USING SOLAR ENERGY

Prepared by: Cheah Wang Onn

ABSTRACT

In the system, a collector called Spherical Reflector/Tracking Absorber (SRTA) collects the solar energy from the rays. The collector will focus all the solar energy to the heat the water, which flow across the collector. Then, the heat energy, which is consisted in the water, will be transferred from the collector loop to the storage loop. Further, the heat energy is transferred to the delivery loop.
