

# DESIGN OF A CONTINUOUS PROCESS COMPOST MAKING MACHINE

Prepared by: Chan Kim Ho

## ABSTRACT

---

The public although is aware that fertilizers make plants grow better, they do not realize the extent of the damage chemical fertilizers can cause to living things.

There are many ideas for recycling organic wastes but few have proven to be cost effective.

I shall introduce the design of my machine to handle the process and solve the problem. Finally, I shall describe how the how each section handles the making of 'gold' from kitchen scraps and garden wastes.

That sums up the objective of my project.
