

FIRE PROTECTION SYSTEM

Prepared by: Lim Jun Shiong

ABSTRACT

In order to reduce the loss of assets and life during a fire, I have come up with a design of a complete fire protection system that is applicable in most multistory building.

The main design objective is to improve the efficient of the existing fire protection system by applying a control circuit that control each motor and component that is needed to perform during a fire. The use electronic component enables the system to work independently and able to tackle fire at the exact position by sending signal to the control circuit.
