

ENGINE OIL REFILLER

Prepared by: Foo Xing Min

ABSTRACT

Engine is the heart of a vehicle and the engine oil is like blood to the engine lubrication system. The engine lubrication system is design to reduce friction and cooling the moving parts in the engine. What happens if an engine is running at warning oil level?

The current engine oil check and refill is done manually by hand. By introducing the 'Engine Oil Refiller', the problems and troubles of manually refilling can be eliminated. The device is designed to refill engine oil automatically when an engine oil level drop is detected.

The following content will tell you more in detail about the purpose of Engine Oil Refiller as well as the applications of engineering theories and the processes in designing and building of the project.
