

# **AUTO RUBBISH COLLECTOR**

Prepared by: Wong Fah Loong

## **ABSTRACT**

---

In developed countries, there are many machines using in the garden such like grass cutter machines to cut the grass. But there are not machines that designed to collect the garbage and useless things in the garden. So the main objective of my project is to design a special and new product to collect this kind of useless things in the garden. The special way is I will not include any motor or electronic devices and just simply using mechanical concept.

In the process to complete this project, we can practice the knowledge we learnt before and also the skills that we do not experience before. This project is supported with some calculation, what are the material used, why are them chosen and how are they being assembly in my model becomes my final prototype. Besides that, problems occurred in this project also being highlighted.

The further details and information about my project are all included in the body of my report.
