

CONVEYOR BELT

Prepared by: Philip Wong Yoon Fook

ABSTRACT

What exactly is a conveyor belt and what does it do?

Well, a conveyor belt is actually a gear system which drives a belt. This system is usually driven mechanically by a motor or other such devices. The motor is connected to rollers which guide the belt of the conveyor belt may stretch over various distances depending on the required length for the use in a specific industry or application.

Throughout the following pages of this project report, I will explain fully the technical or engineering analysis done on this project as well as the design aspects of the conveyor belt. A full report of the project outcomes is also included in this report.
