

DESIGN THE DRUM BRAKE SYSTEM IN THE HEAVY VEHICLE

Prepared by: Khoo Hang Kiang

ABSTRACT

In the high traffic density (means that there is a lot of activity on the road in front of you) and decent from the hill (especially with the high load) you are forced to reach frequently and even occasionally to slam on the brake. Sometimes, however, temperature will be increasing in the brake system. Makes it impossible for you to steer around the source of danger in front of you.

I am going to design the new brake system can transfer heat effectively in the brake system technical potential of being able to slam on the brake and still is able to steer your heavy vehicle, even with difficult road condition, high speed and high load.
