

WATER LEVEL CONTROLLER

Prepared by: Chia Chun Chau

ABSTRACT

This project is about; I call it, the 'Water Level Controller'. What is water level controller? Well, a water level controller is a device that used to control the level of water stored in a container. In other words, this water level controller will help is to shop the flow of water when the level of water in a container reaches the required amount.

The main purpose of using this water level controller is to prevent over flow of water. Since water level controller will help us to stop the flow of water in certain level, so water will not flow out from container.
