

DESIGN AND MANUFACTURE A ROTATION MECHANISM FOR DRYING BLANKET

Prepared by: Chow Lu Yih

ABSTRACT

A new concept of design is introduced where a new method or approach is used for drying a single towel blanket. This design is suitable for family or individual use especially those living in an apartment where space is limited. The design aimed to solve the weakness of the conventional method (line dry method) that humans use currently. This is possible because the design uses a rotation mechanism that can reduce the drying process with using minimum cubic space, thus enhancing and improving the living standard of humans.
