

LIGHT SEEKING ROBOT

Prepared by: Yong Kheng Siong

ABSTRACT

After 14 weeks of hard work, I finally have completed my project. This final report is going to present the project I did which is the light seeking robot – an autonomous robot that is entirely powered by solar energy. In this report, I am going to brief about how my project works and how it can be done. Actually there are lots of ways to build this robot but I have chosen by using PCB board to build it.

This report will give the reader an idea about my project. This report includes main body, which is the most important part of this report, some block diagram, circuit diagram, and of course the problem encountered. However, there are still some improvements that can be made on my project which I have suggested in the conclusion part.
