

DESIGN OF A DOUBLE STOREY CAR SHOWROOM BUILDING

Prepared by: Bagus Santoso Bin Maun

ABSTRACT

First of all, the title of this project is Design of a double story car showroom building. Generally, showroom buildings focus on simple but attractive design, this is because it is aim to attract customers attention thus the main requirement when designing a showroom is to make it appear to be architecturally unique, attractive, spacious and safe. Since it is a double story building, my current idea is to design the building so that the ground floor was meant to be only for showroom where cars will be placed for display. Meanwhile, the second floor of the building will focus on office for management purpose and also several meeting room will be located for staff, client and VIP. The main idea or concept are to avoid mess and crowded situation within the showroom where people should be relaxing and viewing the cars at the ground floor and at the same time not be disturbed with busy office environment. As mentioned, to have an attractive design this project will involve variety application of material such as steel structures, curtain wall, and brick and block work.

An ability to apply variety of material and fulfill the mentioned characteristic of the project, proper research and understanding are required so that one can relate the concept and theory to bring the completion of the project.
