

Logistic Inventory Management System to Support Efficient Inventory Control Flow Mechanism

Prepared by: Aiman Yahya Omar Bahahya

ABSTRACT

Any organization needs people to manage its various activities. A standard organization has various departments with various levels of employees working. Any organization has human resource department, marketing department, front office management, production, logistics, finance department, and other departments relating to the nature of the business. To maintain the activities, people, and finance and plan accordingly, organization needs people. With the increasing demands and the growing needs, its human resource needs are increasing. This is when the organization needs some other system that works better than the existing system with less human resource and finance. Management Information System is a concept that is designed to solve the issues of management in such cases. The management information system takes the advantage of the information technology and tries to collaborate the information technology and management to form the management information system. The MIS solves the problems in various departments.
