

# **An Implementation of Management Information System (MIS) for E.N.T Department in Qi Lu Hospital**

Prepared by: Mi Lan

## **ABSTRACT**

---

Hospital Information System (HIS) has become more and more necessary for every staff who works in a hospital. The integration system has included order entry system, an administrative system, and departmental subsystems within hospital. Staff receives world-wide information for decision making and better communication environment which only can be used on the computer terminals for everyday work (Kazuhiko Ohe, 1995).

Researcher adopted qualitative research method collect effective data from target department and hospital. For example, case study, interview and observation. The scope of proposed system has served four types of users that reception, doctor, nurse and admin. According to qualitative data analyses, researcher selected objective-oriented design (OOD) diagrams to provide primary view of proposed system to the users. Researcher also provided system testing to ensure the final system can be accepted by the end users.
