

Impacts of Virtual Learning and the Proposal of Solution Framework to Improve Virtual Learning in Tertiary Institutions

Prepared by: Koh Siew Yee

ABSTRACT

Virtual learning is a new way of the learning in pedagogical which support the teaching as well as the learning process. There is the significant evidence where virtual learning had brought the benefit especially for those whom being separated by the geographical distance, however, there are still the problems occurred which affects the quality and the efficiency of the virtual learning. From the data collection, the problems have been found to which the main problems usually occurred in the human side as well as the system side. Human side problem can be involved with the human behavior and the attitude, whereas the system side problems involve with the network speed and also the interface design, therefore, the solution framework is proposed in problem solving to improve the quality of the virtual learning to be more efficient and effective.
